Title : Windows Server 2003,
MCSA Security
Specialization Skills Update

Vendors : Microsoft

Version : DEMO

NO.1 You are the network administrator for your company. The network consists of a single Active Directory domain. All servers run Windows Server 2003. All client computers run Windows XP Professional. The network contains a domain controller named DC1. You create a preconfigured user profile on a client computer named Computer1. You need to ensure that all users receive the preconfigured user profile when they log on to the network for the first time. All users must still be able to personalize their desktop environments. What should you do?

- A. From Computer1, copy the user profile to \\DC1\netlogon\Default User.
- B. From Computer1, copy the user profile to \\DC1\netlogon\Default User. Change the User Profile path for all users in Active Directory to \\DC1\netlogon\Default User.
- C. On Computer1, copy the user profile to the C:\Documents and Settings\Default User folder. Share the Default User profile on the network.
- D. Create a Folder Redirection policy in Active Directory.

Answer: A

NO.2 Your network consists of an Active Directory domain. All client computers run Windows Vista. All user accounts have roaming user profiles. You have 10 kiosk computers. The kiosk computer accounts are in an organizational unit (OU) named KioskOU. You need to ensure that all users who log on to the kiosk computer have the same user profile. The solution must ensure that users receive their personalized user profiles when they log on to all computers except the kiosk computers. What should you do?

- A. Modify the profile path settings on the user accounts.
- B. Modify the home directory settings on the user accounts.
- C. Modify the user profile settings by using a Group Policy object (GPO).
- D. Rename %systemdrive%\users\default\ as %systemdrive%\users\default.man on the kiosk computers.

Answer: C

NO.3 Your network consists of an Active Directory domain. You have an organizational unit (OU) named KioskOU and an OU named StaffOU. All user accounts are located in the StaffOU. All user accounts are configured to use roaming profiles. You have a computer named Kiosk1 that runs Windows XP. Kiosk1 is located in KioskOU. You need to prevent user profiles from being stored on Kiosk1. The solution must ensure that users can access their roaming profiles on other computers. What should you do next?

- A. Link a Group Policy object (GPO) to StaffOU. Enable Limit profile size and set it to 0 KB.
- B. Link a Group Policy object (GPO) to KioskOU. Enable Limit profile size and set it to 0 KB.
- C. Link a Group Policy object (GPO) to StaffOU. Enable Delete cached copies of roaming profiles.
- D. Link a Group Policy object (GPO) to KioskOU. Enable Delete cached copies of roaming profiles.

Answer: D

NO.4 You are the network administrator for your company. The network consists of a single Active Directory domain. All client computers run Windows XP Professional. The finance department uses a specific naming process to audit users and their computers. The process requires that each user's client computer has an account in Active Directory created by the IT Department and that each client computer name corresponds to a specific user account. A user named Maria is a member of only the Domain Users security group. She reports that the hardware on her computer fails. She receives a new computer. You need to add Maria's new computer to the domain. You need to comply with the finance department naming process. What should you do?

- A. Instruct Maria to run the `ipconfig /flushdns` command on her new computer and to add the new computer to the domain by using the same computer name as her failed computer.
- B. Assign Maria permissions for adding computer accounts to the default container named Computers. Instruct Maria to add her new computer to the domain.
- C. Reset the computer account for Maria's failed computer. Instruct Maria to add her new computer to the domain by using the same name as her failed computer.
- D. Configure the IP address of Maria's new computer to be the same as the failed computer. Instruct Maria to add the new computer to the domain.

Answer: C

NO.5 Your network consists of a single Active Directory domain. All servers run Windows Server 2003 Service Pack 2 (SP2). The domain contains a member server named Server1. Server1 is a file server. You accidentally delete the computer account for Server1 from the domain. You need to ensure that users can access the file shares on Server1 by using their domain user accounts. You must achieve this goal by using the minimum amount of administrative effort. What should you do?

- A. On Server1, run the `Netdom reset` command.
- B. On Server1, add the computer to a workgroup and then add the computer to the domain. Restart Server1.
- C. From Active Directory Users and Computers, create a new computer account named Server1 in the domain. Restart Server1.
- D. On a domain controller, perform an authoritative restore in Active Directory for the Server1 computer account. Restart Server1.

Answer: B
